Problems in Computer Science are often classified as belonging to a certain class of problems (e.g., NP, Unsolvable, Recursive). In this problem you will be analyzing a property of an algorithm whose classification is not known for all possible inputs.

Consider the following algorithm

- 1. input n
- 2. print n
- 3. if n = 1 then STOP
- 4. if n is odd then  $n \leftarrow 3n + 1$
- 5. else  $n \leftarrow n/2$
- 6. GOTO 2

Given the input 22, the following sequence of numbers will be printed:

22 11 34 17 52 26 13 40 20 10 5 16 8 4 2 1

#### Input

The input will consist of a series of pairs of integers i and j, one pair of integers per line. All integers will be less

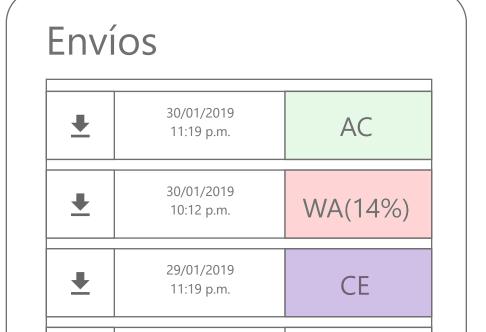

than 10,000 and greater than 0. You should process all pairs of integers and for each pair determine the maximum cycle length over all integers between and including i and j. You can assume that no operation overflows a 32-bit integer

#### Output

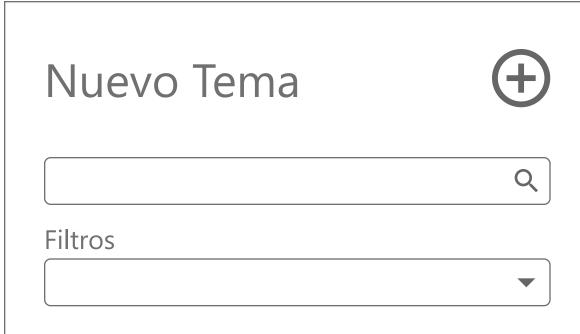

For each pair of input integers i and j you should output i, j, and the maximum cycle length for integers between and including i and j. These three numbers should be separated by at least one space with all three numbers on one line and with one line of output for each line of input. The integers i and j must appear in the output in the same order in which they appeared in the input and should be followed by the maximum cycle length (on the same line)

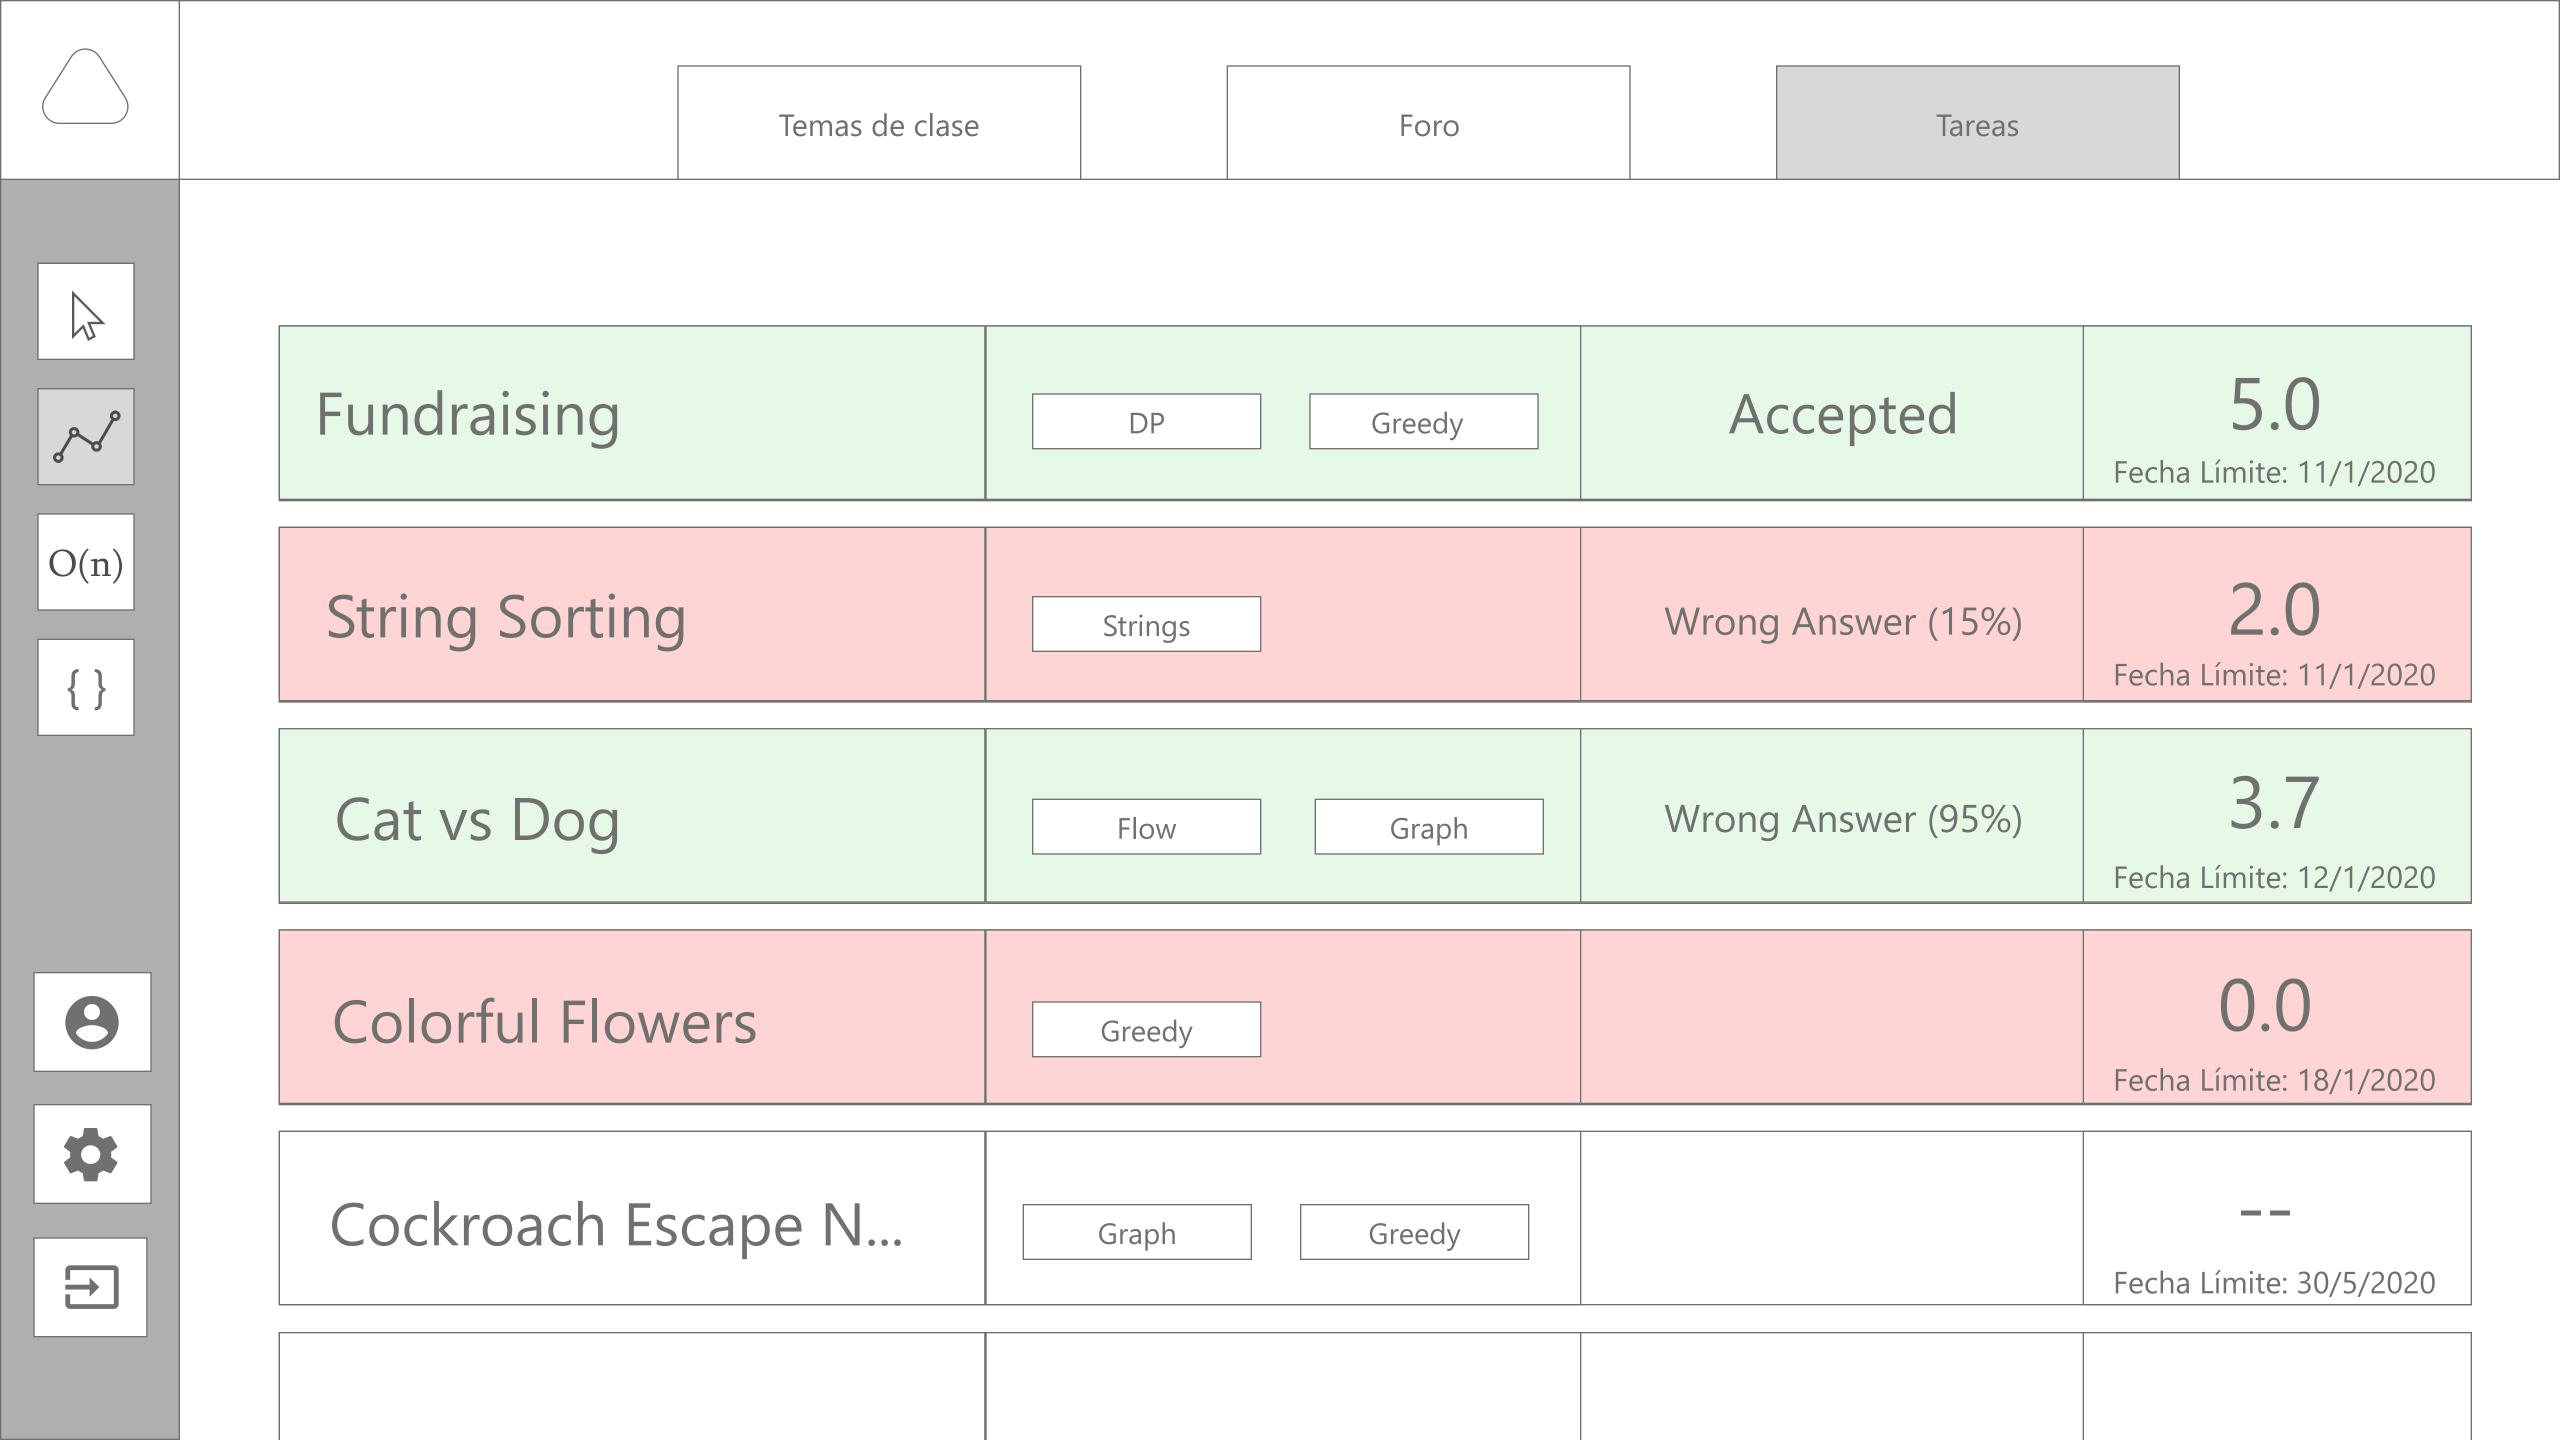

Tareas

## Árboles binarios de búsqueda

Un árbol binario de búsqueda también llamado BST (acrónimo del inglés Binary Search Tree) es un tipo particular de árbol binario que presenta una estructura de datos en forma de árbol usada en informática.

Foro

#### Árbol binario de búsqueda

Sea A un árbol binario de raíz R e hijos izquierdo y derecho (posiblemente nulos)  $H_I$  y  $H_D$ , respectivamente.

Decimos que A es un árbol binario de búsqueda (ABB) si y solo si se satisfacen las dos condiciones al mismo tiempo:

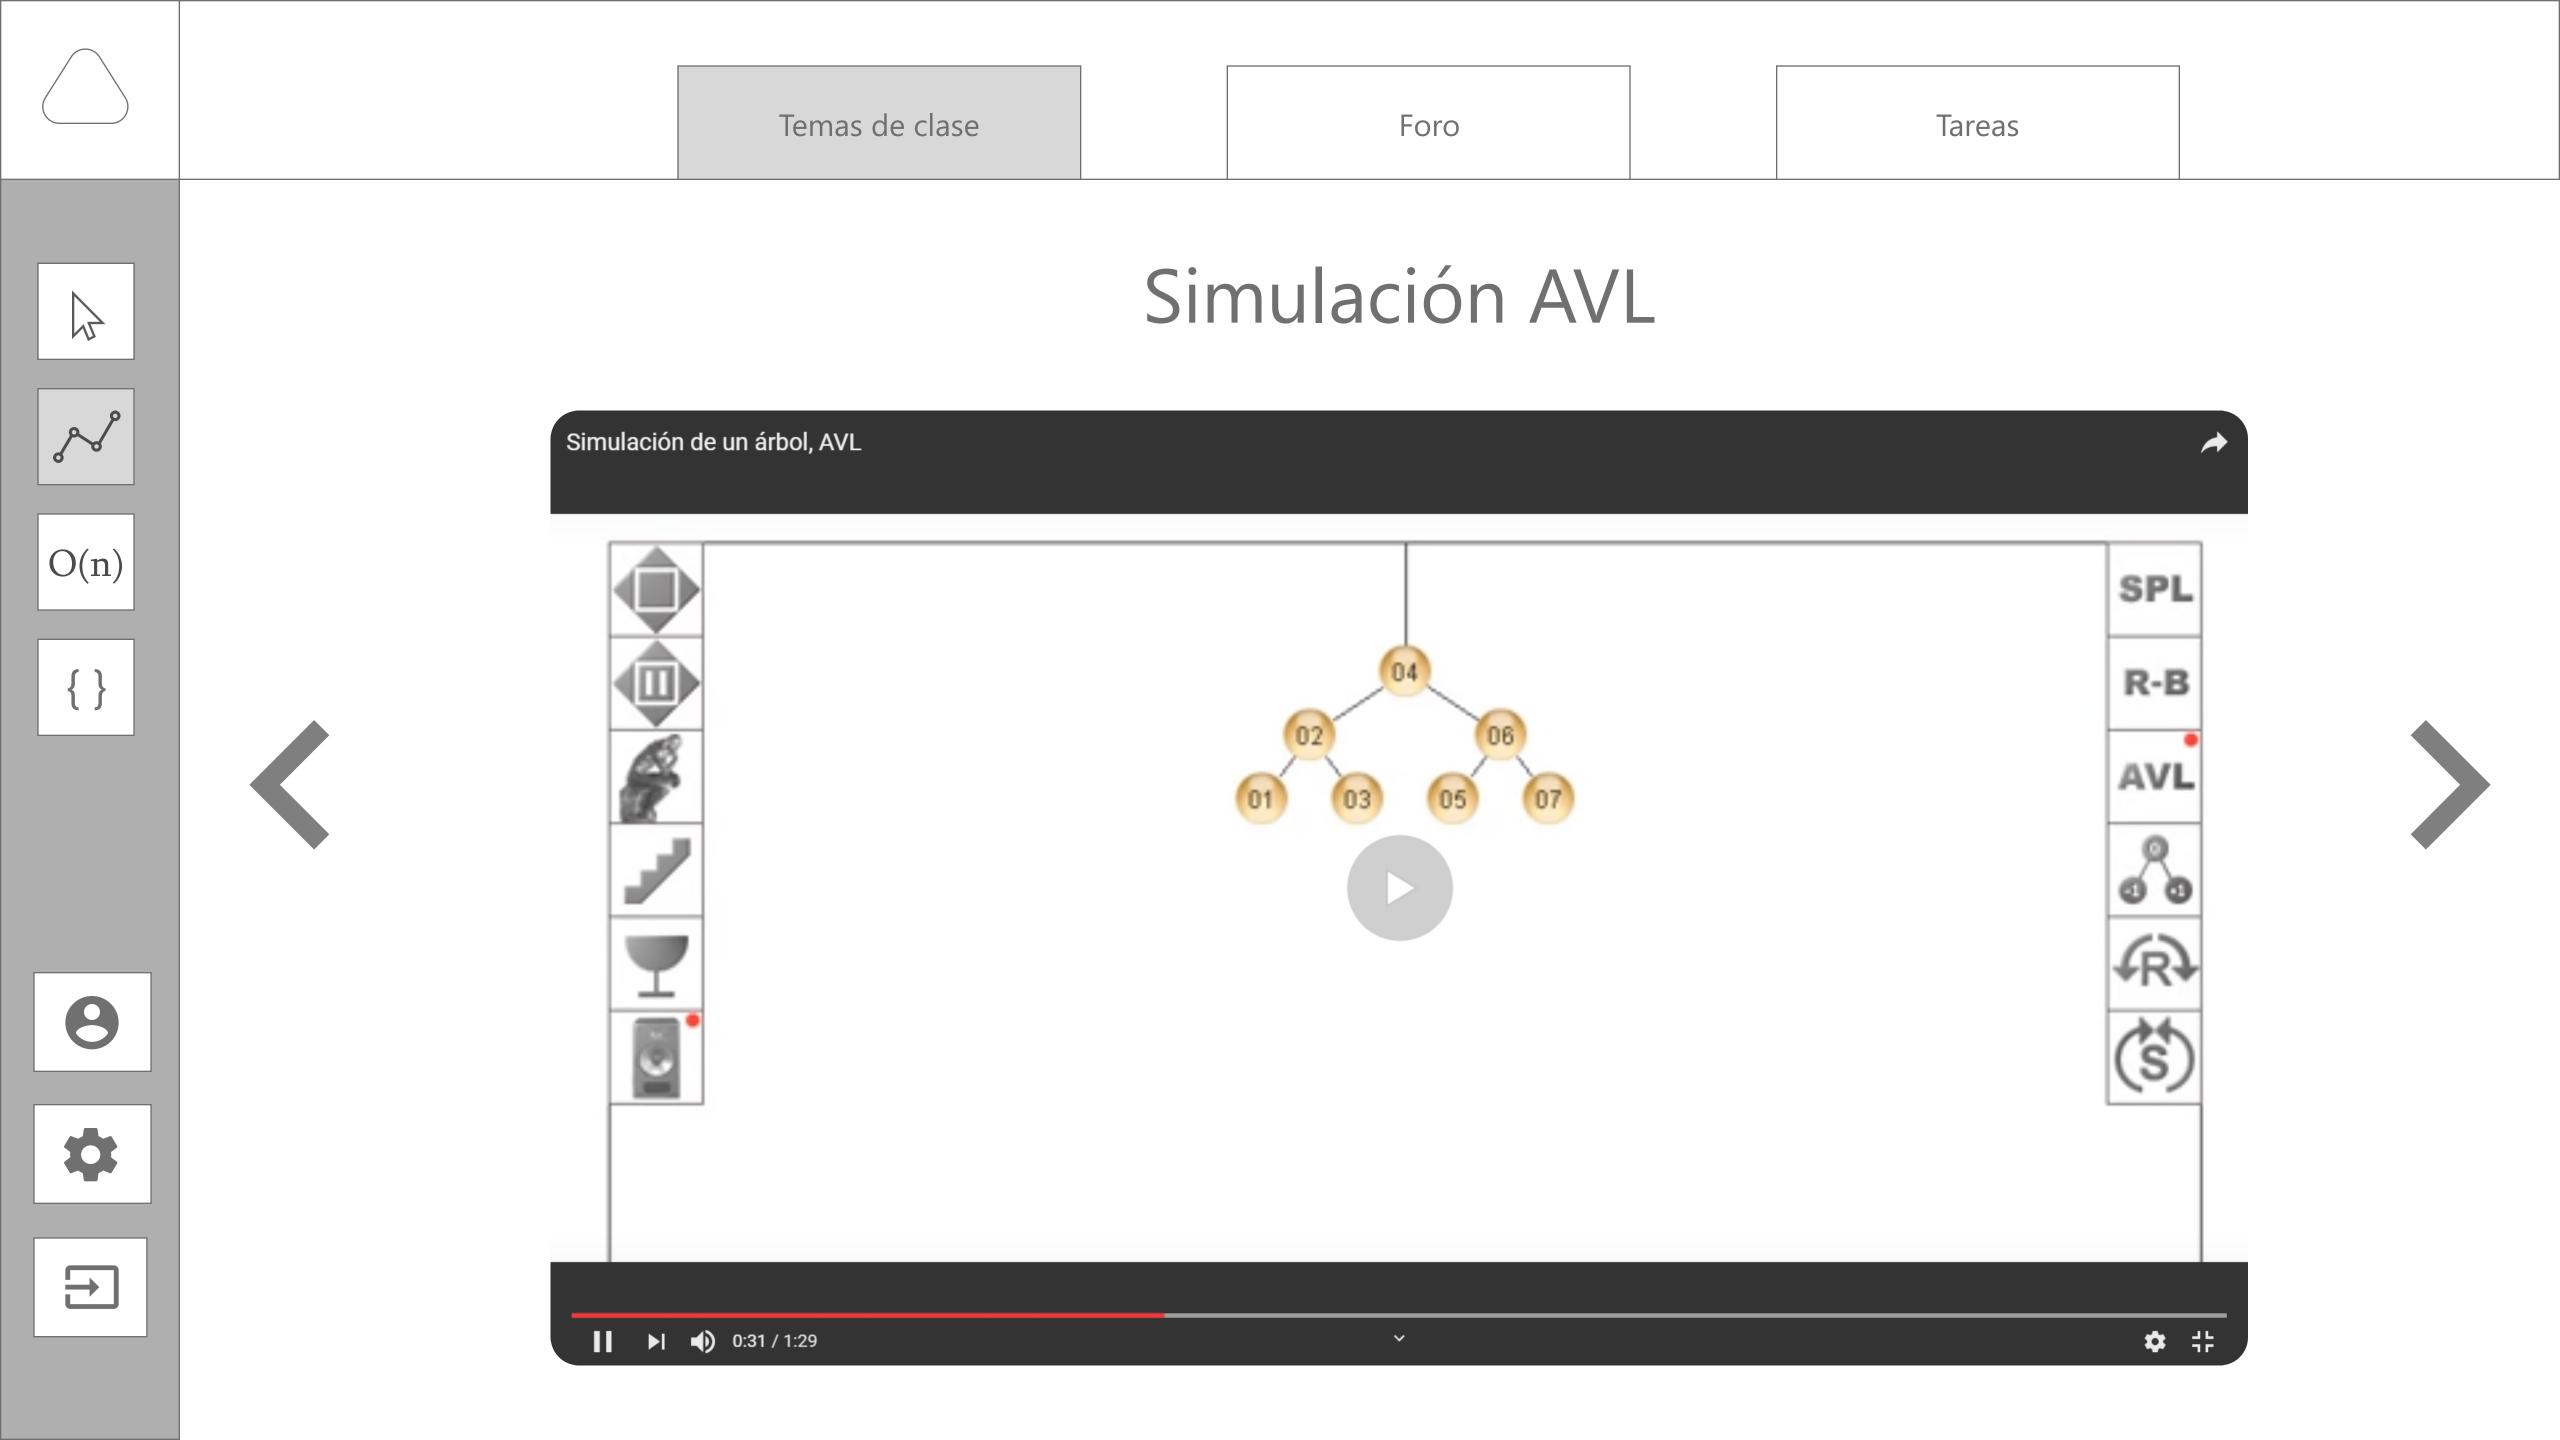

- " $H_I$  es vacío"  $\vee$  ("R es mayor que todo elemento de  $H_I$ "  $\wedge$  " $H_I$  es un ABB").
- " $H_D$  es vacío"  $\vee$  ("R es menor que todo elemento de  $H_D$ "  $\wedge$  " $H_D$  es un ABB").

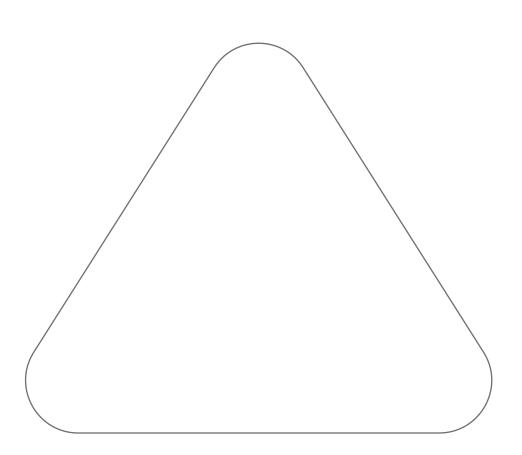

Donde "∧" es la conjunción lógica "y", y "∨" es la disyunción lógica "o".

Para una fácil comprensión queda resumido en que es un árbol binario que cumple que el subárbol izquierdo de cualquier nodo (si no está vacío) contiene valores menores que el que contiene dicho nodo, y el subárbol derecho (si no está vacío) contiene valores mayores.

Para estas definiciones se considera que hay una relación de orden establecida entre los elementos de los nodos. Que cierta relación esté definida, o no, depende de cada lenguaje de programación. De aquí se deduce que puede haber distintos árboles binarios de búsqueda para
